I am a Software Engineering student at Sam Houston State University (SHSU) with a 3.6 major GPA, seeking an internship or entry-level opportunity in software development where I can contribute to backend systems, full-stack applications, and data-driven solutions.

Through coursework and independent projects, I have built and deployed several software systems that reflect practical engineering workflows. One example is a Java-based multi-client chat server implementing a client-server architecture with concurrent user handling and real-time message routing. I also contributed to a database-driven D&D character management system using Python, Spring Boot, and MySQL, where I worked on schema design, CRUD operations, and system validation.

In addition to technical projects, I have developed strong communication and operational skills through roles at Walmart and Taco Bell, including Assistant Manager responsibilities such as coordinating staff, managing inventory, and ensuring accurate financial procedures. These experiences strengthened my ability to work under pressure, communicate effectively, and collaborate in structured environments.

I am particularly interested in roles involving software engineering, backend development, or data-focused systems, and I am eager to contribute while continuing to grow in a professional engineering environment.

Sincerely, Braxton Vogel
